

Testing Before Departure

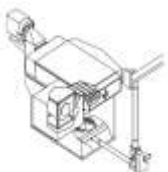

The components that you, the customer, are purchasing are all assembled and test run before shipment. (Boiler Systems are only assembled, not test run.) The assembly process assures that all components fit together properly and efficiently. When your product is ready to ship we know that everything should assemble quickly and easily. Components from IWP ship in sections to make for easy assembly on the job site, for example the grinder above shipped in two bulk pieces. The primary grinder; and the stand, out feed auger, secondary grinder as a separate assembly.

All of the IWP Grinders are test run before they leave our plant. This enables us to do a number of various tasks. Such as making sure every part on the grinder is working properly. If there is ever a problem, it will be found and fixed in our shop before it leaves to save you, the customer, time and heartache. During the test run of your grinder there are also checks done to confirm out feed rate, capacity, and various other studies done.
